Age, sex, employment status, educational level and poverty status are factors that influence high-impact chronic pain prevalence.

- **High-impact chronic pain prevalence among US adults:**
  - Total: 20.4 million
  - 50 million US adults
  - 19.6 million US adults

**Factors Influencing High-Impact Chronic Pain:**

1. **Age:**
   - Prevalence increases with advancing age.
   - No significant difference between 18-64 years and 65+ years.

2. **Sex:**
   - Higher among women.
   - Estimated numbers:
     - Men: 9.6 million
     - Women: 10.0 million

3. **Ethnicity:**
   - No significant influence.
   - Estimated numbers:
     - White: 8.7 million
     - Black: 9.1 million
     - Hispanic: 11.1 million
     - Other: 12.3 million

4. **Veteran Status:**
   - No influence.
   - Estimated numbers:
     - Veteran: 5.1 million
     - Non-veteran: 14.5 million

5. **Education:**
   - Less education means higher prevalence.
   - Less than high school: 16.1 million
   - Some college: 12.5 million
   - High school: 15.8 million
   - Bachelor’s degree: 9.1 million

6. **Employment:**
   - Lower high-impact chronic pain prevalence for employed individuals.
     - Employed: 5.1 million
     - Not employed: 14.5 million

7. **Poverty:**
   - Less income means higher prevalence.
   - Less than poverty level: 16.0 million
   - 100% to 200% of poverty level: 11.1 million
   - 200% to 400% of poverty level: 7.4 million
   - More than 400% of poverty level: 4.4 million
